

ELECTROKIT

The Electrokit has been designed and developed to fit virtually any make, model and size of pedal cycle available, and when fitted will give you the most economical short distance commuter on the market today. As easy to use as an ordinary bicycle and costing only pence to run. It has a range of about 15 miles on one charge of the battery, at speeds of up to 15 mph.

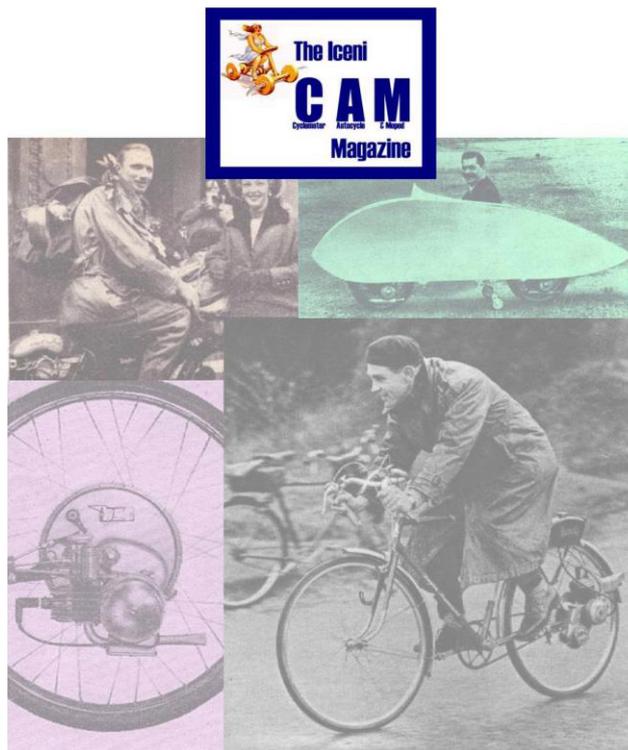

The kit is supplied in various options to suit both the pocket and ability of the customer. It comes complete with comprehensive step-by-step fitting instructions, and, in its fullest specification, is complete down to the last nut and bolt. Fitting can be accomplished by any average handiman in about two hours. The unique drive unit consists of a specially developed motor and reduction gearbox mounted to the front forks. The power is controlled by a handlebar push button, which when pressed transmits the power smoothly and quietly through a chain and sprocket drive to the front wheel. The battery and its associated components fit on to the rear carrier.

The cycle can be used with the motor or the pedals, or for the most benefit, both together. Used in this manner hills can be climbed with ease and longer journeys can be tackled. Even if you do run out of battery power, you can always pedal home. Make those everyday cycle trips a pleasure by fitting the Electrokit and giving your bike and yourself a new lease of life. No noise, maintenance pollution and no licence, tax, insurance or crash helmet are needed. A full specification of the Electrokit options appears on the attached sheet.
